### Quick Start Guide

**Movavi Photo Editor** is a versatile photo editing tool that can help you easily fix and enhance your photos.

**Step 1: Open a photo**

Drag and drop a photo from **Windows Explorer** onto the **Photo Editor** window, or click **Browse for Images** to open a photo.
Step 2: Edit the image
Next, use the tools to edit and improve the image. Click a button on the top sidebar to open the tab with the corresponding tool, and then modify the image.

**Editing the photo dimensions**
Use the **Rotate** tool if you need to rotate or flip a photo, or fix the photo’s horizon level. [Rotating images]

Use the **Crop** tool if you need to cut off the edges of the photo or change its proportions. [Cropping images]

Use the **Resize** tool if you need to export a smaller copy of the image. [Resizing images]

**Erasing objects and retouching**
Use the **Object Removal** tool if you need to remove unwanted objects from the picture or fix some defects. [Erasing objects]
Replacing the background
Use the Background Removal tool if you need to cut out a picture’s background. You can leave the background transparent or replace it with a color or a different image.

Photo retouching
Use the retouching tools to get rid of small imperfections and apply make-up effects to your portraits.

Adjusting colors
Use the Adjust tool to fix a photo’s colors or add a creative touch. Click the Magic Enhance button for a quick automatic enhancement, or use the sliders to manually improve the brightness, contrast, saturation, and other properties.

Applying effects
Use the Effects tab to apply a creative effect to a photo. Simply click on an effect you like to apply it to the image.

Adding text
Use the Text tab to add text boxes to the image. You can add as many lines as you like and fully customize the font and position. With a combination of effects and text you can make creative greeting cards and motivational posters.
Step 3: Save the image
1. Click the Save button at the bottom of the window.
2. Choose a folder and name the new image.
3. Click Save.

Removing trial restrictions

How to activate Movavi Photo Editor
When you first install a copy of Movavi Photo Editor, it will be running in trial mode. You will be able to save 10 photos with the Movavi watermark. To be able to use the program to its fullest, you will need to activate it using an activation key that you can purchase from our official website or any of our partners.

Follow the instructions below to activate your copy of Movavi Photo Editor:

Step 1: Buy activation key
1. Click the button below to go to the purchase page and click the Buy Now button there.

Buy Activation Key

2. You will be taken to our web store. Fill in your billing information and payment options and proceed with the purchase form. IMPORTANT! Be sure to enter a valid e-mail address; it will be used to deliver your activation key.
3. Once you have placed your order, you will shortly receive a confirmation for your order and an e-mail from support@movavi.com containing your activation key.

Step 2: Open the activation window
1. Open Movavi Photo Editor.
2. Open the Activation menu and choose Activate Software. The activation window will appear.

Step 3: Enter your activation key
1. Enter the activation key into the corresponding box.
2. Click Activate to complete the activation.
This step requires a working Internet connection to verify your key. If you aren't connected to the Internet, try offline activation.

Having problems with activation?
If activation is not working as expected, try the following:
• Make sure that the activation key is entered correctly and is intended for the program you are activating.
• Try activating offline via e-mail.
• Contact us at support@movavi.com and we'll help you solve the problem!

Activating without Internet access
If the computer you have installed Movavi Photo Editor on is not connected to the Internet, you can activate the program via e-mail.

Getting an activation key
You can purchase an activation key from the official Movavi website or from any of our partners. To purchase a digital copy from the official website, follow the steps below:

Step 1: Go to the purchase page
To open the purchase page for Movavi Photo Editor:
• In the Activation menu, choose Buy Activation Key, or
• Follow the link below...

Step 2: Choose a license type
• If you plan to use Movavi Photo Editor at home, click Buy Now on the purchase page to proceed with buying the personal license.
• If you plan to use Movavi Photo Editor at work, in a government institution, or gain profit in any way, go to the Business license tab on the purchase page.

After that, you will be redirected to an online store depending on your region and the available payment methods. All of our vendor partners are secure and completely safe.

Step 3: Fill in your billing details
1. Choose any of the available payment methods.
2. Fill in the information required on the page.
3. Enter a valid e-mail address. This e-mail will be used to deliver your activation key.

Step 4: Get your activation key
After the purchase has been verified, you will receive a letter containing your activation key. Now you can use it to activate the program.

If you haven't received your activation key within the hour:
• Check the Spam folder of your mailbox.
• Contact support.

Activating Photo Editor

How to activate Movavi Photo Editor
Activating Movavi Photo Editor will let you use the program forever and save your photos. Activation requires an Internet connection to verify your key.

You will need:
• Movavi Photo Editor activation key. You should receive your key via e-mail right after your purchase is completed. Don’t have a key? Buy now.
• Internet access to verify your key. Don’t have Internet access? See this guide on offline activation.

Step 1: Open the activation window
1. Launch Movavi Photo Editor.
2. Open the **Activation** menu and select **Activate Software**. The activation window will open.

Step 2: Enter your activation key
1. Enter or paste your activation key into the corresponding box of the Activation window.
2. Click **Activate** to verify your activation key.

This step requires a working Internet connection to verify your key. If you aren't connected to the Internet, try offline activation.

If you have entered the key correctly, you should see a message confirming successful activation. Click OK to complete the activation process and restart the program.

**Having problems with activation?**
- Check that the activation key is entered correctly and is intended for the program you are activating.
- Try offline activation.
- Contact our support team.

**Movavi Photo Editor**

**Activating without Internet**

**How to activate Movavi Photo Editor without Internet access**

Activation requires Internet access to verify your activation key. If you don't have a working Internet connection on the computer that **Movavi Photo Editor** is installed on, you can activate the program via e-mail using any other computer or device. You will be asked to send us an automatically generated e-mail and then enter the reply into the program’s Activation window.

You will need:
- **Movavi Photo Editor** activation key. You should receive your key via e-mail right after your purchase is completed. Don’t have a key? [Buy now](#).
- A device or another computer that can be used to send and receive e-mail.

Step 1: Open the activation window
1. Launch **Movavi Photo Editor**
2. Open the **Activation** menu and select **Activate Software**. The activation window will open.

Step 2: Enter the activation key
1. Enter or paste your activation key into the corresponding box of the Activation window.
2. Select the **Activate offline** option.
3. Click **Activate** to proceed to the next step.
Step 3: Send an e-mail with the provided information

The next window contains important activation information that you will need to send us via e-mail in order to activate your program.

1. Click the Copy button to copy the information in the window. If necessary, save or transfer this information to the computer or device that you will be sending the e-mail from.

2. On the computer with an Internet connection, open your mail client and compose a new e-mail. Paste the information you’ve copied earlier into the message body and send this e-mail to reg@movavi.com. The activation server will then verify your activation key and send you an automatic response containing a registration key, which you will need to enter into the Activation window. You should receive the server’s reply within an hour.

Step 4: Enter your registration key

1. When you have received your registration key, save it and go back to the Activation window.
2. Enter the registration key into the corresponding box.
3. Click Activate to submit the information.
Once activation is complete, you may be asked to restart the application.

If you're having problems with offline activation:
• Make sure that the keys are entered correctly and are intended for your version of Movavi Photo Editor.
• Make sure you have administrator rights on your computer.
• Contact our support team.

Opening images

How to open images in Movavi Photo Editor

Drag-and-drop
Find the necessary image in Windows Explorer and then drag it from Windows Explorer right onto the Photo Editor window.

Browse
On the start screen, click the Browse for Images button. A Windows Explorer dialog box will appear. There, choose the file you want to edit and click Open.

Recent file
On the start screen, click Open last edited file. The thumbnail next to it shows which image was opened last.

File menu
Open the File menu and choose Open. A Windows Explorer dialog box will appear. There, choose the file you want to edit and click Open.

Movavi Photo Editor

Zoom and navigation

How to use the navigation controls
Zoom
When you open an image, it will be fitted to the window size. Use the zoom and navigation tools at the bottom of the window to set a comfortable view.

Fit to screen – adjusts the zoom level so that the entire image can fit in the window.

Actual size – sets the zoom level to 100%, displaying the image as it is.

Hand tool – to move an image around while zoomed in, click the hand icon and hold the left mouse button to move the image. Then, click the hand icon again to go back into editing mode. You can also move the image at any time by holding the left mouse button and Space on your keyboard or by clicking both mouse buttons at the same time.

To magnify an image, use the zoom slider at the bottom of the window. You can also zoom in and out using the mouse wheel. When you zoom in or out, the current zoom level will be displayed to the right of the navigation controls.

Navigation
Now you can sort through entire photo folders and edit their contents on the fly. Use the file navigation buttons at the bottom of the window:

Go to the previous image in the folder.

Go to the next image in the folder.

Delete the current image.

Click and hold to view the original of this image before editing.

Click to compare your working copy with the original image.

Click to view all the images in the folder.

If you have made changes to the file before switching to the previous or next file, you will be asked to save or discard the changes.

Movavi Photo Editor

Image adjustments
The Adjust tab allows you to improve the photo’s brightness, contrast, color, and other properties. Click the Adjust button on the top to open the image adjustments.
Automatic adjustments
For an instant fix, use the buttons in the **Quick Adjustments** section. The **Magic Enhance** button sets the best value for each color correction setting. You can tweak the results using the sliders below. The **HDR Lighting** button automatically adjusts the brightness and contrast, highlighting both dark and light parts of the image.

White balance
White balance tool lets you remove unrealistic color casts, so that objects which appear white in person are rendered white in your photo. To use it, click the color picker icon on the right-hand panel. Find a white or closest to white spot on your photo and click on it. White balance will be adjusted automatically.

Manual adjustments
If you need more specific adjustments, use the sliders on the **Adjust** tab to achieve the necessary result. To reset a slider adjustment, simply double-click it. If you’ve changed a few values and want to cancel all the adjustments, click the **Reset** button underneath the sliders.
Brightness
Allows you to change the overall amount of light in the whole image, without changing any other parameters.

Contrast
Allows you to change the difference between the lightest and darkest parts of the image. This can help you make the image more vivid, but too much contrast can cause unwanted posterization.

Saturation
Allows you to make the colors richer (positive values) or more subdued (negative values). Settings Saturation to -100 will make the image grayscale.

Exposure
In photography, exposure is the amount of light that is allowed to reach the camera’s sensor, which is usually achieved using a combination of shutter speed, aperture, and lighting. If there is too much light on average, you may lose some details in the dark parts, while the light areas may become ‘washed-out’, and vice versa. This allows you to imitate a higher or lower exposure, as if you set it on your camera when taking the shot.

Highlights and Shadows
These two sliders allow you to make each component more prominent in the image, and thus make the image darker or brighter.

Sharpness
Allows you to sharpen the image. Please be aware that oversharpening an image can add noise.

Details
Allows you to bring out more details in an image.

Blur
Allows you to slightly blur the image to reduce noise or smoothen out defects.

Temperature
Allows you to make the image feel warmer or colder, by adding orange or blue color respectively.

Tint
Allows you to add a red or green tone to the image, either for color correction, or for an artistic feeling.

Hue
Allows you to change an image’s overall color. Unlike tinting or color temperature (see below), changing an image’s hue will not color the picture in shades of one color, rather, it will shift all the image’s colors in a given direction.

Adjusting a specific part of an image
If you want to change the color setting only of a specific part of your photo, use the Selection Tools on the right-hand panel.

- **Selection Brush**: Select objects freely.
- **Lasso Tool**: Select an object by tracing its outline.
- **Polygonal Lasso Tool**: Select an object by tracing its outline using straight lines.
- **Magic Wand Tool**: Quickly select objects of the same color.
- **Rectangular Marquee Tool**: Select a rectangular part of the image.
- **Selection Eraser**: Deselect areas of the image.

Select the area you want to work on and make the necessary adjustments. The changes will be applied only to the selected area.
Movavi Photo Editor

Retouching

Use the retouching tools to get rid of small imperfections and apply make-up effects to your portraits.

Click the Retouching button on the top to open the retouching tab.

Skin smoothing

How to make skin smoother

Step 1: Choose Skin smoothing from the Skin section on the right-hand panel.
Step 2:
1. Adjust the brush size and its softness using the **Brush size** and **Brush softness** sliders.
2. Set the tool intensity using the **Smoothing intensity** slider.
3. Then paint along the skin to smooth it.

Use the **Eraser** to remove smoothing from any excess areas.
*Tip: you can change the intensity after applying the effect.*

Step 3: Click **Apply** to save the changes. To discard the changes, click **Reset**.

---

Wrinkle removal

**How to remove wrinkles**

**Step 1:** Choose **Wrinkle removal** from the **Skin** section on the right-hand panel.
Step 2:
1. Adjust the brush size and softness using the Brush size and Brush softness sliders on the right-hand panel.
2. Set the tool intensity using the Intensity slider.
3. Then simply paint along the wrinkle to erase it.

Step 3: Click Apply to save the changes. To discard the changes, click Reset.

Movavi Photo Editor

Shine removal

How to remove skin shine
Step 1: Choose Shine removal from the Skin section on the right-hand panel.
Step 2: Click the **Remove Automatically** button on the right-hand panel to remove the excess shine from the portrait.

If the program can't recognize the face automatically or you're dissatisfied with the result, you can use the manual mode. Adjust the brush size using the **Brush size** slider on the right-hand panel. Then simply paint the skin to make it less shiny.

Step 3: Click **Apply** to save the changes. To discard the changes, click **Reset**
Foundation

How to apply the make-up foundation effect to a portrait

Step 1: Choose **Foundation** from the **Skin** section on the right-hand panel.

Step 2:
1. Choose a color and set its intensity using the **Color intensity** slider.
2. Adjust the brush size and its softness using the **Brush size** and **Brush softness** sliders.
3. Then paint along the face to color it.

Use the **Eraser** to remove any excess color.

*Tip*: you can change color and its intensity after applying the effect.

Step 3: Click **Apply** to save the changes. To discard the changes, click **Reset**.
**Blush**

**How to apply the blush effect to a portrait**

**Step 1:** Choose **Blush** from the **Skin** section on the right-hand panel.

**Step 2:**
1. Choose a color and set its intensity using the **Color intensity** slider.
2. Adjust the brush size and its softness using the **Brush size** and **Brush softness** sliders.
3. Then paint along the cheekbones to color them.

   Use the **Eraser** to remove any excess color.

   Tip: you can change color and its intensity after applying the effect.

**Step 3:** Click **Apply** to save the changes. To discard the changes, click **Reset**.
Red eye removal

How to remove the red eye effect from a photo

**Step 1:** Choose **Red eye removal** from the **Eyes** section on the right-hand panel.

**Step 2:** Click the **Remove Automatically** button on the right-hand panel to remove the red eye effect.

If the program can’t recognize the face automatically or you’re dissatisfied with the result, you can use the manual mode. Adjust the brush size using the **Brush size** slider on the right-hand panel. Set the brush size to slightly larger than the pupil. Then simply click the pupil to remove the red eye effect.
Step 3: Click Apply to save changes. To revert changes click the Reset button.

Movavi Photo Editor

Eye enlargement

How to make eyes bigger in a portrait

Step 1: Choose Eye enlargement from the Eyes section on the right-hand panel.

Step 2: The face recognition process will start automatically. Wait until you see the “Face(s) recognized successfully” message pop up on top of the image. If there are several faces in the photo, click the one you want to apply the effect. Click the Enlarge button on the right-hand panel.
Step 3:
Drag the **Intensity** slider to adjust the effect.

Step 4:
Click **Apply** to save changes. To revert changes click the **Reset** button.

---

**Changing eye color**

**How to change eye color in a portrait**

**Step 1:** Choose **Eye color** from the **Eyes** section on the right-hand panel.
Step 2: Choose a color, set its intensity and brush size using the sliders on the right-hand panel. Make sure to set the brush size slightly larger than the iris. Then simply click on the iris to recolor it.

Use the Eraser to remove excess color from the pupil or the surrounding areas.

Tip: you can change color and its intensity after applying the effect.

Step 3: Click Apply to save the changes. To discard the changes, click Reset.

Movavi Photo Editor

Eyeshadow

How to apply the eyeshadow effect to a portrait

Step 1: Choose Eyeshadow from the Eyes section on the right-hand panel.
Step 2:
1. Choose the eyeshadow color and set its intensity using the **Color intensity** slider.
2. Adjust the brush size and its softness using the **Brush size** and **Brush softness** sliders.
3. Then paint along the eyelids to color them.

You can use the **Eraser** to remove excess color.

*Tip:* you can change color and its intensity after applying the effect.

Step 3: Click **Apply** to save the changes. To discard the changes, click **Reset**

Movavi Photo Editor

**Mascara**

**How to apply the mascara effect to a portrait**

**Step 1:** Choose **Mascara** from the **Eyes** section on the right-hand panel.
Step 2: Set brush size and color intensity. Make sure that the brush diameter is slightly larger than eyelash length. Then paint along the eyelid to color in the lashes.

Use the Eraser to remove excess color from the surrounding areas.

Tip: you can change color and its intensity after applying the effect.

Step 3: Click Apply to save the changes. To discard the changes, click Reset.

**How to make face thinner**

**Step 1:** Choose **Face slimming** from the **Others** section on the right-hand panel.

**Step 2:** The face recognition process will start automatically. Wait until you see the “Face(s) recognized successfully” message pop up on top of the image. If there are several faces in the photo, click the one you want to apply the effect. Click the **Slim Down** button on the right-hand panel.
Step 3: Drag the **Intensity** slider to adjust the effect.

Step 3: Click **Apply** to save changes. To revert changes click the **Reset** button.

---

**Movavi Photo Editor**

**Reshaping tools**

**Step 1:** Choose **Reshaping tools** from the **Others** section on the right-hand panel.
Step 2: Select one of the reshaping tools:

- **Reshaping Brush** - moves pixels with the movement of the brush. Click and hold on the object you want to reshape. Then drag the brush as if you were stretching the object.

- **Shrinking Brush** - moves pixels towards the center of the brush. Simply click on the object you want to shrink using this tool.

- **Enlarging Brush** - moves pixels away from the center of the brush. Simply click on the object you want to enlarge using this tool.

Step 3: Change the object’s shape using the selected tool. You can adjust Brush size and Intensity for each tool.

Step 4: Click Apply to save changes. To revert changes, click the Reset button.

Movavi Photo Editor

**Clone stamp retouching**

How to remove small skin blemishes using the stamp tool
Located on the **Object Removal** tab, the **Clone Stamp** tool can help you manually correct small blemishes, remove wrinkles, or clone (copy) objects on an image.

**Step 1: Open the Object Removal tab**
Click the **Object Removal** button to open the retouching options.

**Step 2: Select the Clone Stamp tool**
Click the stamp icon at the top to select the **Clone Stamp** tool.

**Step 3: Set the stamp size and softness**
Use the **Stamp size** slider beneath the tool icons to set the stamp’s size. Increasing **Stamp softness** will make the stamp’s edges more transparent, which can help you blend the stamped parts with the rest of the image.

**Step 4: Pick a source**
Move your mouse pointer over to the area that you want to clone (e.g. a similar area without blemishes). Hold down the **Alt** key and click on the image to define a source point.
**Step 5: Paint over the target**
Release the Alt key. Then, move your mouse pointer to where you want the cloned fragment to appear and paint over the area you want to replace. As you move your cursor while painting with the stamp, the sampled area will also move relative to your cursor position.

**Erasing objects**

**How to erase objects from a photo**
The Object Removal tab can help you erase unwanted objects or people from your images. With a special algorithm, the background is reconstructed as if the deleted objects were never there. All you need is to mark the objects you want to remove.

**Step 1: Switch to the Object Removal tab.**
Step 2: Choose a selection tool
At the top of the Object Removal tab, choose a tool you're comfortable using.

- **Use the Selection Brush Tool** to freely paint the red selection area. The Brush Size slider below will set the brush size.
- **Use the Magic Wand Tool** to select adjacent areas of uniform color in a single click.
- **Use the Lasso Tool** to outline an object. Click the arrow on the lasso icon to change the type of lasso:
  - The standard **Freehand Lasso** allows you to freely draw the object's outline.
  - The **Polygonal Lasso** allows you to outline the object with straight lines.
- **Use the Selection Eraser Tool** to deselect parts of the image. Just like with the brush, you can change eraser size with the slider below. *(The eraser only affects your selection, it does not erase objects in the photo).*
- **Use the Stamp Tool** to select a part of the image to transfer onto another part of the image. You can use the **Clone Stamp** Tool to mask small blemishes or duplicate objects.

Step 3: Mark unwanted objects
Using the selected tool, mark the objects you want to delete in the image. As you paint, these objects will be marked with red.
The people marked with red will be removed from the image.

Tips and hints:
• If you've made a mistake, use the Eraser to deselect parts of the image. Just like with the brush, you can change eraser size with the slider under the tools.
• When selecting people and objects, don't forget about their shadows and reflections.
• If you need to erase several objects, you can select them all at once or erase them one by one.
• To clear all selections from the image, click Reset Selection.

Step 4: Set Variation
When you remove an object, the program will replace that object with pixels from the rest of the image, so as to blend into the background. The Variation slider affects how far away from the object the replacement pixels can be taken from. For lower variation values, the replacement pixels will be taken from the area only directly adjacent to the object, while at 100 they can be taken from any part of the image.

Different variation values will provide different results depending on the size of the object, its background, and the overall uniformity of the image. Try out a few values to see which works best for your pictures.

For example, in this image it would be best to select a lower variation so that the sea is not cloned onto the sand.

Step 5: Erase!
Click the Start Erasing button to begin processing. Please note that erasing objects with high variation values will take slightly longer. If you aren't satisfied with the result, you can click the Undo button and adjust your selection or choose a different variation value. Repeat steps 3-5 to remove any other objects you want.
Step 6: Clone retouching (optional)
If there are some more small defects left over after erasing, you can manually correct them with the Clone Stamp tool. You can select a patch of the image and copy it over the defects.

1. Select the Clone Stamp tool.
2. Hold down the Alt key and click onto the part of the image that you want to clone. Usually, it should be close enough to the blemish so that the copied spot is similar to the original in color and texture.
3. Paint over the blemish with the copied sample. The source will also move as you paint with the stamp, in order to give a more natural look to the edited parts.

Learn more about clone retouching

Movavi Photo Editor

Crop

How to crop images
Cropping an image allows you to save it with a different aspect ratio, remove unwanted parts from the edges, and zoom in on objects inside the image. We recommend that you save a backup copy of the image before cropping, in case you need the original image later. Click the Crop button on the top side of the window to open the Crop tab.

Step 1: Open the Crop tab
Click the Crop button on the top to open the cropping options.
Step 2: Define size
Next, specify the size and proportions that you want. There are several ways to set the size:

**Crop frame**
A crop frame will be visible over the image. Drag inside the image to draw the cropping rectangle, or move the edges of the crop frame with your mouse.

**Pre-defined sizes**
On the right-hand panel you can select a suitable size from the list. Here you can find some commonly used sizes and presets for quickly changing the proportions of the image.

**Manual input**
If you need a specific size in pixels, you can manually enter the width and height into the corresponding boxes. To switch the width and height, click the Invert Proportions icon.

**Lock aspect ratio**
Selecting this option will maintain the selected width to height proportions. This way, when you change one dimension of the cropping rectangle (whether by drawing the cropping area or by entering a number for width or height), the other dimension will change accordingly to keep the selected aspect ratio. To lock aspect ratio click the lock button on the right from the width and height boxes.

Step 3: Apply changes
Click the Apply button to accept the cropping changes. To discard the changes, click Reset.
Text

How to add text to a photo
The Text tab allows you to add text to your images. Use text to create image postcards, but remember – a picture is worth a thousand words!

Step 1: Click the Text button on the top to switch to the Text tab.

Step 2: In the Text tab, click the Add Text button. A new text area will appear in the photo.

Step 3: Enter your text in the Add Text field.
Step 4: Set a font, size and color for your text.

Step 5: Drag the text area with your mouse to place it inside the image. To rotate the text area or resize the text, drag at the resizing button in the bottom right-hand corner of the text area.

Step 6: Set the background and frame color, position of the text and add a text warp if needed.
Click on the **Decorations** button to choose additional decorations from our library.

**Removing text:**
- Select a text area and click the **Delete** button in its upper left-hand corner to remove just that one caption.
- To remove all captions, click the **Remove All Text** button in the Text tab.

**Tip:** you can edit multiple objects at the same time. Press and hold **Ctrl**, then select the objects. To ungroup them, right-click on the group and select **Ungroup object**.

### Changing backgrounds

**How to erase and change photo background**

Movavi Photo Editor can help you quickly and easily cut out people and objects from any background. You can use it to create product photos, funny collages and more.

**Step 1: Open the Change Background tab**

On the top side of the window, click **Change Background**.
Step 2: Mark the object and background
You can choose between Brush and Lasso for the selection.

Auto Select
If you are working on a photo with people in it, you can click the Auto Select button to automatically select the silhouettes. You will be able to refine the selection later on Step 2.

Brush
Mark the foreground and background
1. Click the Brush + icon and roughly mark the foreground objects that you want to keep. There is no need to color the entire object, but if the objects have a lot of small details, you may need to add a few extra strokes.
2. Click the Brush - icon and roughly mark the background that you want to remove. Pay closer attention to parts of the background that have similar color or pattern to that of the foreground.
3. If you've made a mistake, click the Eraser button and remove the selection.

Once you've marked the foreground and background areas, Photo Editor will outline the foreground object with a line. Sometimes, you may need to correct this outline by adding a few strokes of the green or red brush. For higher precision, use a smaller brush size or zoom in on the details.
4. Depending on the amount of detail around the edges of the foreground object, you may want to change how the edges are detected. Try different **Boundary Smoothness** values to find which works best for your image.

**Lasso**

1. Click the **Selection Lasso** icon and trace the outline of the object you want to keep.

2. Click the **Extraction Lasso** icon and trace the outline of the areas you want to subtract from the selection.

Use these shortcuts for easier selection:
- **Del** to delete the last or selected point
- **Esc** to delete the outline

Once you’ve marked the foreground and background areas, Photo Editor will outline the foreground object with a line.

*Note: Don’t worry if the selection is not perfect, you will have a chance to fix it on Step 2.*

Click **Next Step** to continue.

**Copying and pasting objects**

If you want to clone the selected object, right-click on it and choose **Copy** or press **Ctrl+C** on your keyboard. Then finish erasing the background and press **Apply** (steps 3-5). After that right-click on it and choose **Paste** or press **Ctrl+V** to paste the selected object.

*Note: You can only copy and paste objects when you use the Brush.*

**Step 3: Refine Edges (optional)**

On the next step, you can correct the selection using different tools.

- Use the **Mask Brush** to correct the selected area. **Foreground Mask** adds to the mask, **Background Mask** subtracts from it.
- **Hair Selection Tool** is made specifically for changing background on portraits. Hair can be very hard to select correctly. This tool does it for you, simply paint along the hair outline to refine the selection.
Click **Next Step** to continue.

**Step 4: Select new background**

1. The background will be cut out and you can proceed to choosing the new background.

2. Now, you can choose to leave the background transparent or choose a new background color or image.

**Transparent:**
If you want to keep a transparent background, click the ‘transparency’ icon to the left of the color palettes.

**Grayscale colors:**
To use a standard white, grey, or black background, choose one of the color icons.

**Color picker:**
Use the Color Picker tool to select a color on any image opened on your screen. By clicking a point on an image, you can change the active color to that which is located under the pointer.

**Custom color:**
To choose a different color, click the arrow on the rightmost color sample to open the palette. Choose a color using the palette or spectrum. You can also set a color using its HTML or RGB code on the right.

**Image:**
To open an image to use as the background, click the **Add Image** button and select the background you want to use from the library or upload your image. It will then be added as the new background. After that, you can move and resize the foreground objects on the new background. If you switch to a color or transparent background, you can later return to using the image by clicking the preview under the **Add Image** button.

3. If the edges of the foreground object look too sharp, use the **Blur Edges** slider to blend them with the background.

4. Use the **Shift edges** slider if you need to shrink or expand the entire selection. This can be useful for objects with a lot of details around the edges.
5. The **Adjust colors to background** slider makes the color range of the object more similar to the background. It makes the whole photo look more natural.

**Step 5: Move and resize the object**

Click and drag your object to move it anywhere you want in the image. Drag the blue circle icons to change the object's size. To rotate the object, rotate the blue circle on top, beyond the object's border.

If the object is much smaller than the original image size, you can later **crop the image**.

**Step 6: Apply changes**

Finally, click **Apply** to accept the changes. Please note that if you switch to another tab while removing a background, your selection will be lost.

If you want to cancel cutting out the background and discard the selection, click **Reset**.

Don't forget to **save your changes**! If you've left the background transparent, make sure to save the image in a format that supports transparency, such as PNG, BMP or TIFF.

Movavi Photo Editor

### Frames

**How to add a frame to a photo**

**Step 1:** Click the **Frames** button on the top panel to open the frames library.

**Step 2:** Select the frame you like and simply click on it to apply it to your photo. To go the frame’s settings, click the **gear-wheel** icon on the top right hand corner.
Step 3: Here you can adjust frame size and color and round the corners on the frame. When you are happy with the result, click Apply to save the changes.

Noise removal

How to remove digital noise from a photo

Step 1. Click the Denoise button on the top to open the noise removal options.

Step 2. Select one of the presets on the righthand panel. Presets are sorted by intensity: the first one is for photos shot in good light with some technical noise, the last one is for night shots.
You can adjust each preset manually. To do that, click the settings button on the top-right corner of the thumbnail.

Click the **Save preset** button if you want to save the settings and have quick access to them later. You can find all the saved presets on the **Custom presets** tab.

Movavi Photo Editor

**Restoration**

Automatically restore old photos from your family collections: fix tears or damages, adjust faded photos.

**Step 1:** Click on the **More** button on the top and choose **Restore**
Step 2: Select the **Enhance photo** option if you also want to automatically adjust brightness and contrast of the photo.

Step 3: Select the **Colorize photo** option if you also want to automatically colorize your photo.

Step 4: Click the **Restore** button to start the restoration process.

**Note:** If the **Colorize photo** option is not selected, the photo will be turned to black & white.
Copying and pasting objects

How to paste images and copy fragments
Use the marquee tools to copy, cut and paste parts of an image.

Step 1. Click on the More button on the top and choose Insert Image

Step 2. Choose a selection tool.

- **Rectangular Marquee.** Use this tool to select a rectangular part of an image.
- **Polygonal Lasso Tool.** Use this tool to select an object with straight edges by tracing its outline with lines.
- **Lasso Tool.** Use this tool to select an object by freely tracing its outline.

Step 3. Select an object you want to copy or cut.
Step 4. Copy and paste the selected part of the image.

• To copy the selected object, right-click on it and choose Copy or press Ctrl+C on your keyboard.
• To cut the selected object, right-click on it and choose Cut or press Ctrl+X on your keyboard.
• To paste the selected object, right-click on it and choose Paste or press Ctrl+V on your keyboard.

To paste an image from your computer, click the Paste an Image button. An Windows Explorer window will open. Choose an image you want to paste and click the Open button.

After you have pasted the object, image settings will pop up on the right-hand panel.

Step 5. Adjust the pasted area.

• On the right-hand panel, you can set outline width and color.
• If you chose rectangular marquee, you can round corners of the selection using the Rounded corners slider.

Step 6. Adjust the shadow.

• On the right-hand panel, you can turn on the shadow.
• Adjust the shadow color and angle and set the blur intensity.
Click and drag the object to move it anywhere you want in the image. Drag the blue dot icons to change the object’s size.

To delete the pasted image click the blue cross icon or press Delete on your keyboard.

Movavi Photo Editor

Rotating images

**How to rotate and flip images**

The Rotate tab allows you to flip, rotate, and straighten out images with slanted horizon levels. Click on the More button on the top and choose Rotate.

**Rotate and flip images**

Use the buttons on the **Rotate and Flip** tab to rotate the image by 90 degrees or to mirror the image.

- ![Rotate](image)
  - Rotates your photo 90° counterclockwise

- ![Flip](image)
  - Flips your photo horizontally (left to right)

- ![Flip](image)
  - Rotates your photo 90° clockwise

- ![Flip](image)
  - Flips your photo vertically (upside-down)

**Straighten images**

A tilted horizon is a frequent problem for both beginner and experienced photographers when shooting from a handheld camera. This tool allows you to easily correct tilting in your photos, and you won’t have to worry about horizon levels when taking your pictures.

The **Straighten** slider allows you to manually rotate the image up to 45° either way.
Using the Level Tool:
The Level Tool can help you automatically straighten out the image.

1. In your photo, find a straight horizontal or vertical line. This can be the horizon, the side of a building, or any other lines that are parallel or perpendicular to the horizon.

2. Now, click the Level Tool and trace that line on your image. Once you’ve traced the line, the image will be automatically rotated to make that line exactly horizontal or vertical.

Effects

How to apply effects to a photo
Adding effects allows you to add a creative touch to your photos and easily convey your emotions.

Step 1: Click the More button on the top and choose Effects to open the effects tab.
Step 2: Click on **Popular** to see the list of effect groups. Click on a group to open it and show the relevant effects.

Step 3: Choose an effect you like, click on it and it will appear in the photo!

Step 4: For some effects, you can use the **Intensity** slider under the effect’s thumbnail to modify the effect’s strength or detail level. To apply an effect click the check mark button under the thumbnail.
Tip: You can apply multiple effect to one photo.

Removing effects
To remove an applied effect, click the cross button under the thumbnail or simply click on it once more.

Movavi Photo Editor

Resizing images

How to change the size of an image
Resizing images allows you reduce an image’s file size, prepare pictures for uploading to web albums, which often have a size limit, or prepare web-sized images for blogs and websites.

Tips:
If you intend to make other edits to the photo, it is best that you do them prior to resizing it, since the image quality will then be preserved better. Also, we recommend that you save a copy of the image before resizing in case you may need it later, especially if you plan on printing out the image.

Step 1: Go to the Resize tab
On the top panel of the window, click the Resize button to switch to the Resize tab.

Step 2: Enter new dimensions
Select or enter the necessary image size:
• To enter a custom image size, enter the dimensions into the width and height boxes. You can change the measurement unit in the box on the right. The default unit is pixels.
• Or select from the most common image sizes from the table.
• To view more sizes click Another size in the bottom of the panel.
• To avoid visual distortions of the image after resizing, keep the Constrain proportions option enabled.
Step 3: Apply changes

Finally, click **Apply** to resize the image to the specified size. Don’t forget to **save the image** when you’re done!

---

Movavi Photo Editor

**Saving images**

**How to save an image in Movavi Photo Editor**

**Step 1:** Click the **Save** button in the bottom right-hand corner or open the **File** menu and click **Save** to rewrite the previous image, or click **Save As** to save the image under a different name.

**Step 2:** You will see the saving window.
• Choose the **File name** and select the **File type** from the list.
• You can choose where the file will be stored in the **Save to** field. Click **Browse** to open the Windows Explorer.
• Select the **Remove GPS data** checkbox if you don’t want the photo to store any location information.
• The **Show file in folder after saving** option automatically opens the output folder in Windows Explorer after saving.

**Step 3: Metadata settings (optional)**

Click on the **Metadata settings** in the saving window to open the settings.

Here you can add an author and a comment to your photo. If you don’t want the file to store any additional information, select the **Remove all metadata** checkbox.

**Step 4:** Finally, click **Save**

---

**Changing image format**

**How to save images in different formats**

Changing an image’s format allows you to use your images in a wider variety of situations or compress the images to a smaller file size. Many websites only allow a limited number of formats for uploading, so having a tool to easily change image format becomes a must.

**Step 1:** After you’ve opened and edited an image, click **Save** in the bottom right-hand corner of the window. The **Save File** dialog box will open.
Step 2: To choose an image format, open the File type box and select the format you need.

Some formats also allow you to set image quality and compression method.

**JPEG Quality**
Drag the slider to the necessary quality level. Lower quality allows you to compress the image to a smaller file size, but will probably not look as good.

**TIFF Compression**
Select the preferred compression method:
- **Uncompressed** no compression method will be used. The image will be much larger in size than its compressed copies, but uncompressed images with large resolutions may be processed faster by some software.
- **PackBits** offers less compression than LZW, but is the most widely supported compression method, especially on Apple software.
- **LZW** compresses the image to about half size.
- **ZIP** best for working with 16-bit images and average for 8-bit images.

Step 3: Choose where to save the new file and give your file a name.

Step 4: Click Save.
If you make any edits after saving the file in a different format, you will be working with the new file.

Movavi Photo Editor

**File information**

**Where to find file information**
To see a photo’s media properties, go to the File menu and choose File Information.
Or press the File Information button at the bottom of the window.

A File Information window will appear. Here you can find the file size, dimensions, format, and other properties of the original file. Knowing certain information about a file will allow you to better understand which settings are best for your photo.
Even though image files rarely take up more disk space than videos or other media files, a large photo collection can quickly fill up your hard drive if you save all photos at the maximum size and quality. In this section, you will learn how to manage image file size.

Image file size is defined by the following properties:

**Image size in pixels**
The larger the image, the more pixels it will be made up of, and the more data will need to be stored. The number of pixels also defines image resolution for printing, and affects the maximum level of detail you can achieve for a print of a certain size.

To reduce file size, you can **resize the image**. However, this comes at a cost: the smaller copy will look just as good, but if you want to print out the image or use it as wallpaper, the smaller file will look considerably worse than its original.

Let’s see how much disk space you can save by resizing images. Below are the file sizes for one image (here, you see a scaled-down preview), and the difference is amazing, resizing a large image to a viewable 800x600 size makes the file size over a hundred times smaller.

<table>
<thead>
<tr>
<th>Dimensions</th>
<th>File Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>7899x5924 px</td>
<td>27.6 MB</td>
</tr>
<tr>
<td>800x600 px</td>
<td>168 KB</td>
</tr>
</tbody>
</table>

If you want to upload previews of your images to the web, or share photos in web albums, resizing the photos will most likely be a good idea: the upload times will be faster, and if you have a storage limit, it won’t be filled up as fast as if you uploaded the images at their original size.

**Hint:** Don’t scale up small, low-quality images.

An image with small dimensions does not have enough data in the file to allow any program to fully restructure the quality of a larger size image. If you size them up, you will only be wasting disk space without any improvement in quality.

Read our resizing guide

**Image complexity**

Image complexity plays a large role in file size. Due to image compression specifics, images with different content but identical size and format will differ in file size because of the details that will need to be preserved. For example, if you save a large image of a purely blue background, some compression methods will only need to store which color fills the whole image, while for a picture of a flower, all the small details will be stored to avoid quality loss.

Note the images below. They are of identical dimensions and are both saved in JPEG format. One image is a photo of a complex and colorful flower, while the other is a plain blue background. The second image's file size, having to encode less data, is 48 times smaller than the first! And while you can’t simplify your photos to a single color, keep in mind that some images will naturally have larger file size than others.

<table>
<thead>
<tr>
<th>Dimensions</th>
<th>File Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>425x282 px</td>
<td>144 KB</td>
</tr>
<tr>
<td>425x282 px</td>
<td>2.98 KB</td>
</tr>
</tbody>
</table>

**Format and compression method**

A compression method can be seen as a shorthand writing system for image editing software, where it can write all the data of your image into less space, and then decipher the shorthand to recreate the image on your screen when you open the file. Most image compression methods do not store all of the image’s data pixel by pixel, since it would take significantly more disk space. Instead, the image compression algorithm finds a way to pack this information by finding identical parts and only recording those same parts once, or by throwing away some data that it finds less important. Different formats have different compression methods, and choosing the best format largely depends on the type and purpose of the images.

**Lossless formats:** some formats can store the image without losing any data, meaning that the quality of the image will not decrease when you save it. These formats can store the image either at its full size, or use a lossless compression method, that will pack the image into a smaller file, yet retain the original quality. No matter the compression level, these files are rather large, but offer the benefit of higher quality and sharper images, which is especially important for text images and logos.

**Common lossless formats:** PNG, TIFF, BMP
‘Lossy’ formats: other formats allow you to save the images into smaller files, but they compress images at the expense of some quality. For large photos, the trade-off is usually justified, as the human eye will probably not notice the difference at low compression levels. However, when manually adjusting quality of ‘lossy’ formats, such as JPEG, it is important not to set the quality too low to enjoy the image.

The most common ‘lossy’ format: JPEG

When you change an image’s format, note that saving it to a lossless format will not improve its quality, but only preserve the existing data. Likewise, if you change an image from a lossless format to a ‘lossy’ one, some data will inevitably be lost to compression.

Saving files in a different format
Movavi Photo Editor

Printing images

How to print images in Movavi Photo Editor

Printing the image

To print out an image from Movavi Photo Editor

1. Open the File menu and choose Print.
2. Choose the printer you want to use for printing the photo.
3. Click Settings to open the settings for the selected printer. The settings will vary depending on your printer’s software, but generally you can choose paper size, orientation and color options.
4. Choose the number of copies that you want to print. If this is your first time printing a photo, you may want to first print only one sample copy to make sure you have set up everything right.
5. Click Print to begin printing.

Image printing guidelines

Follow these guidelines to ensure the best possible print quality:

1. Make sure the image is large enough for printing on the selected paper size, and conversely, choose the right paper size for your images. If you print small images on large paper, you may find that you can see individual pixels or that the image is not smooth enough on print. Before taking the photos you want to print, use a camera with a high megapixel count, make sure that it is set to the highest available quality (some cameras allow you to shoot smaller images than the camera’s maximum size), and provide good lighting conditions to minimize noise.

The larger the original photo, the larger a print size you can afford without losing crispness and quality. The standard for printing images is to have at least 300 pixels per inch of the photo paper. The following table shows the correlation between image size and its printed size when printed at 300 pixels per inch (~118 pixels/cm). You can use it to match paper size to your image size and vice versa.

<table>
<thead>
<tr>
<th>Camera Megapixels</th>
<th>Image Size in Pixels</th>
<th>Printed Size in Inches</th>
<th>Printed Size in Centimeters</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>1600 x 1200 px</td>
<td>5&quot; x 4&quot;</td>
<td>13 cm x 10 cm</td>
</tr>
<tr>
<td>3</td>
<td>2048 x 1536 px</td>
<td>7&quot; x 5&quot;</td>
<td>17 cm x 13 cm</td>
</tr>
<tr>
<td>4</td>
<td>2464 x 1932 px</td>
<td>8.2&quot; x 5.4&quot;</td>
<td>21 cm x 14 cm</td>
</tr>
<tr>
<td>5</td>
<td>2560 x 1920 px</td>
<td>8&quot; x 6&quot;</td>
<td>21 cm x 16 cm</td>
</tr>
<tr>
<td>6</td>
<td>2816 x 2112 px</td>
<td>9&quot; x 7&quot;</td>
<td>24 cm x 18 cm</td>
</tr>
<tr>
<td>8</td>
<td>3264 x 2468 px</td>
<td>11&quot; x 8&quot;</td>
<td>28 cm x 21 cm</td>
</tr>
<tr>
<td>10</td>
<td>3872 x 2592 px</td>
<td>12.1&quot; x 9.1&quot;</td>
<td>33 cm x 22 cm</td>
</tr>
<tr>
<td>12</td>
<td>4000 x 3000 px</td>
<td>13&quot; x 10&quot;</td>
<td>34 cm x 25 cm</td>
</tr>
</tbody>
</table>

If you didn’t find the necessary size in the table, you can easily calculate the printed size in inches by dividing the width and height in pixels by 300. Likewise, to find out the minimum number of pixels for a certain print size, multiply the width and height in inches by 300 to get the image dimensions in pixels.

2. You do not need to downsize the image before printing, the software will automatically fit the image onto the selected paper size. Downsizing the image will only reduce quality.

3. If you need to crop unwanted parts of the image, make sure that the end result is not too small. If you have a very large image, you can use the crop function to zoom in on objects in the image, but keep in mind that the output image size must be large enough for printing. You can check the image size in pixels by clicking the File Information button on the bottom panel.

4. Use a high quality printer for printing out your photos. These simple guidelines will help you choose a printer:

   • Inkjet printers are much better at printing images than laser printers. Dye sublimation printers are considered the best for printing photos, however they are quite rare and can only be used for photo printing.
   • Check the printer’s dots per inch (DPI) resolution; the higher the DPI, the higher quality prints it will be able to produce. For photo printing, make sure that the printer has at least 300x300 DPI.
   • Generally, a dedicated photo printer will produce better results than a general-purpose multifunction printer of the same price range.
   • Some printers may produce colors different from the original because of the way they convert RGB color (the color scheme you see on your monitor) to CMYK color (used for printing).
   • Be aware of your printer’s maximum print size; many consumer printers only print photos up to 8 by 10 inches (20.32 x 25.4 cm). You should find this information on the packaging or in the printer’s user manual.

5. Use high quality photo paper. There are different kinds of photo paper that may work differently depending on the content of your image. For example, glossy paper is better at reproducing bright colors, while matte paper is more suitable for portraits. Also, make sure that the paper matches your printer type (i.e. laser or inkjet).

Calibrating your Display

The colors you see in print may be slightly different than those you see on your display due to LCD monitor specifics. You can try to calibrate your display for better previewing.
1. Open the **Control Panel**
2. Type "**Calibrate display**" into the search box.
3. Click **Calibrate display color**. This requires administrator permissions.
4. Follow the onscreen instructions to calibrate your display.

Movavi Photo Editor

**Program settings**

To open the **Photo Editor** preferences, click the **Settings** button at the top of the window to open the settings menu. There, click **Preferences**.

You will see the settings window. Here you can manage the following options.

### General settings

- **Interface language** – to change the interface language, simply select the necessary language from the list and click **OK** to apply the changes.

- **Automatically check for updates** – select this option and you’ll be notified whenever a new version is available. Updates within your version are absolutely free (e.g. 1.0 to 1.1), while new releases are offered with a hefty discount to registered users.

- **I give consent to send anonymous usage stats to Movavi** – checking this box will allow the program to send usage statistics to our development team, enabling us to fix any bugs you may encounter much faster, as well as add new features that you might be missing. The data contains no personal information, will not be disclosed to third parties and will be used for software improvement purposes only. [Learn more about how we use the statistics](#).

- **Save extended logs for troubleshooting** – in case you experience trouble using the program and contact our support team, they might ask you to collect logs. The logs contain the program’s actions for some period of time, as well as important error reports and descriptions. Extended logs give the most amount of information which may be essential to solving your problem.

### Files settings
Here you can set where to store temporary files that Photo Editor creates while working with your photos. Click Browse and choose a new folder for temporary files. To go back to the default settings, click Reset.

Movavi Photo Editor

**Keyboard shortcuts**

For faster editing, the most commonly used actions are bound to shortcuts or hotkeys.

**To open the list of shortcuts:**
1. Open the Settings menu.
2. Select Keyboard Shortcuts.

**To change a shortcut:**
1. Double-click the field next to the action you want.
2. Press the key or key combination you want to use.

Movavi Photo Editor

**Help and support**

Didn’t find what you were looking for? Need help with a problem? Have a suggestion? Contact our support team and we’ll help you right away.

**How to reach us**
- By e-mail: support@movavi.com
- Fill out a support form

We guarantee a response within 3 business days!

If you ran into a problem, please describe it in as much detail as possible; any screenshots, log files, or information about your system will allow us to help you faster.

**Frequently asked questions:**
- How to remove trial restrictions?
- What are the system requirements for running Movavi Photo Editor?
- How to update the graphics card drivers?

**Updating graphics card drivers**

If you encounter an error message asking you to update your graphics drivers, you will need to download a new driver from your graphics card manufacturer's website and install it on your system. Some graphics card drivers also have a useful utility that notifies you when a driver update is available and updates the driver automatically. Keeping your graphics card drivers up-to-date will ensure stable performance of applications and games on your computer.

**Step 1: Find your graphics card manufacturer**
1. Right-click your desktop and choose **Screen Resolution**
2. In the Screen Resolution settings window, click **Advanced settings**
3. This will open your graphics card properties. At the top of the window, your graphics card model will be listed under the **Adapter Type** section. Note the full name of the graphics card somewhere for later.

**Step 2: Download the new version**
Now that you've learned your graphics card manufacturer and model, go to the manufacturer’s website and find driver downloads. There, look for the model or series that you've found earlier and download the driver installation file. Some manufacturers may also offer a utility that will automatically find the necessary driver.

NVIDIA download center
AMD download center

Warning:
Only download drivers from the official manufacturer’s website. Third-party websites offering driver downloads may contain malware.

**Step 3: Install driver**
Once the file is completely downloaded, run the installation file and follow the onscreen instructions to install the driver on your system. Your display may blink several times in the process. After the installation has finished, it is advised that you restart the computer.

**Updating NVIDIA® Driver**
Modern NVIDIA graphics cards come with a special application called NVIDIA GeForce™ Experience that monitors driver updates and allows you to optimize your computer’s graphics performance.

1. Open the NVIDIA GeForce Experience application. It should already be installed on your system. If you cannot find the application, please try the method above.
2. In the **Drivers** section, click the **Check for updates** button to find the latest drivers.
3. When the application has found a newer driver, click the **Download driver** button. From here, the software will automatically download and install the necessary driver for your system.

**Updating AMD® or ATI® Driver**
1. If you have an AMD or ATI graphics card, go to the Driver Download Center on AMD's official website.
2. Download the auto detect utility and run it when the download has finished.
3. The utility will then automatically find your graphics card and help you download and install the right driver for your system.
   If the utility fails to find a driver for you, you can manually select your graphics card model and operating system on the Driver Downloads page and download the driver.
4. After the driver has downloaded, run the installation file and follow the on-screen instructions to install it.
5. After the driver has been installed, it is recommended that you restart your computer.

If none of the above steps have helped, feel free to contact our support team via e-mail support@movavi.com or live chat.

If possible, please include the name of your graphics card model (see Step 1), as well as screenshots of any error messages you have encountered. This will help our support team specialists solve your problem quicker.

**How to collect logs**
Providing your log files when you contact support can help us solve your problem faster. The logs contain the program’s actions for some period of time, as well as important error reports and descriptions. The log files do not contain any personal information.

Note that extended logs give the most amount of information which may be essential to solving your problem. To save extended log files, go to General Preferences and check 'Save extended logs for troubleshooting'.
**Step 1: Show hidden folders**
1. Open the Control Panel and switch to Small icons view.
2. Click Folder Options.
3. Switch to the View tab.
4. Under Hidden files and folders, choose Show hidden files, folders, and drives.
5. Click OK.

**Step 2: Open the Logs folder**
1. Go to your system drive (usually Local Disk C).
2. Open the Users folder.
3. Open the folder with your username.
4. There, open the AppData hidden folder.
5. From there, go to Local > Movavi > Logs.

*Advanced* you can also simply enter the following into Windows Explorer’s path bar at the top: “C:\Users\USERNAME\AppData\Local\Movavi\Logs”, where USERNAME should be your user folder. 
*Note that the path may vary depending on your Windows version.*

**Step 3: Send us the logs**
1. Find the folder named Movavi Photo Editor 6.
2. Archive this folder and attach this archive to your e-mail, support chat or contact form when you describe your problem.
